

Two-component syringe

Cooled Syringe

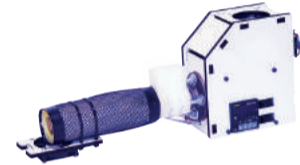

Curing system with ultraviolet light

Extruder and pellet system

Creation of filament from a material in pellet format with winding system to facilitate the storage of the filament created.

Refrigeration system

Fluid recirculation system capable of delivering temperatures up to 25

Heated Syringe

Heating by electrical system and uniform distribution of heat with electronic control.

(imagen no disponible)

Refrigerated bed

Fluid recirculation system, to maintain a constant temperature below the ambient temperature.

(imagen no disponible)

Heating bed

Deposition platform with a totally uniform heating system over its entire surface, with electronic control to keep the temperature stable.
